

LM321-CM

Low Power Single Operational Amplifiers

Features

- Internal frequency compensation
- Output short circuit protection
- Low power: 0.3mA(typ.)@VCC=5V
- Single power supply voltage range: 3V~32V
- Dual power supply voltage range: $\pm 1.5\text{V} \sim \pm 16\text{V}$
- Gain bandwidth product: 1.0MHz

Applications

- Charger
- Power application
- Desktop computers and motherboards
- Communication infrastructure

SOT-23-5

Description

The LM321 is a single-channel low-power differential operational amplifier. It can be powered by a single power supply or a dual power supply. The LM321 has a high open-loop gain, internal compensation, a wide common-mode input range, good temperature stability, and the feature of output short-circuit protection. It can operate under power voltages ranging from as low as 3.0V to as high as 32V, and the common-mode input range includes the negative power supply. This eliminates the need for external biasing, and it can also drive large-capacity loads.

The LM321 is available in a SOT23 – 5 package, allowing for low-cost integration into various applications without sacrificing valuable board space.
